

Lower anterior crowding treated to this point with 4 aligners and moderate IPR. One aligner “refinement” planned to complete correction of rotations.

Upper anterior crowding treated with 4 aligners. Example of how aligners correct rotations with minor IPR.

Moderate lower anterior crowding treated with 5 aligners. Approximately .5mm IPR was performed between each anterior contact.

Clear Image Aligners

Specialty Appliances offers a fast, accurate and affordable alternative for the correction of minor to intermediate anterior misalignments. The patient wears a series of up to 5 clear appliances to gently align the anterior teeth. We use a sophisticated process to calculate and measure each tooth movement on the laboratory model, delivering predictable outcomes for your patient.

Anterior tooth movement that responds well to this therapy includes: lingual/labial repositioning, rotations, slight mesial/distal shifting. For every case of Clear Image Aligners, we offer the option of two refinement trays if fine tuning is necessary.

We invite you to review a wide selection of aligner cases on our website at:

www.specialtyappliances.com.

Also, please refer to the “How to Get Started” section to send your aligner cases to Specialty.
